

IN THE CLAIMS

1. (Original) A digital payload for processing a sub-band spectrum received on an uplink beam at a communications satellite, the digital payload comprising:
 - a digital channelizer configured to divide the sub-band spectrum into a plurality of frequency slices;
 - a digital switch matrix configured to route each of the plurality of frequency slices to at least one of a plurality of receiving ports; and
 - a digital combiner configured to communicate with the receiving ports to receive the plurality of frequency slices and to re-assemble the plurality of frequency slices to thereby form a plurality of output sub-bands for transmission on an output beam of the communications satellite.
2. (Original) The digital payload of claim 1 further comprising a digital regeneration module configured to demodulate at least a portion of the sub-band spectrum to extract a digital bitstream therefrom, to digitally process the bitstream, and to remodulate the bitstream after processing.
3. (Original) The digital payload of claim 2 wherein the digital regeneration module is further configured to digitally process the bitstream by performing error correction.
4. (Original) The digital payload of claim 2 wherein the digital regeneration module is further configured to digitally process the bitstream by performing code division multiplexing.
5. (Original) The digital payload of claim 2 wherein the digital regeneration module is further configured to digitally process the bitstream by performing access control.
6. (Original) The digital payload of claim 2 wherein the digital regeneration module is further configured to digitally process the bitstream by performing network registration.

7. (Original) The digital payload of claim 2 wherein the digital regeneration module is further configured to digitally process the bitstream by performing cryptographic manipulation of the bitstream.
8. (Original) The digital payload of claim 1 further comprising a controller configured to monitor bandwidth consumption of the sub-band spectrum and to adjust the bandwidth consumption in response thereto.
9. (Original) The digital payload of claim 1 further comprising a built-in test circuit.
10. (Original) The digital payload of claim 1 further comprising an analog to digital (A/D) converter configured to receive the uplink beam and to produce the sub-band spectrum therefrom.
11. (Original) The digital payload of claim 10 wherein the A/D converter is further configured to sample the uplink beam at an IF frequency rate.
12. (Original) The digital payload of claim 1 further comprising a digital-to-analog (D/A) converter.
13. (Original) The digital payload of claim 12 wherein the D/A converter is further configured to operate at an RF frequency rate.

14. (Original) An all-digital payload for processing a plurality of sub-band spectra received on a plurality of uplink beams at a communications satellite, the digital payload comprising:
 - a digital channelizer configured to divide each of the sub-band spectra into a plurality of data packets;
 - a digital switch matrix configured to route each of the plurality of data packets to at least one of a plurality of receiving ports;
 - an embeddable digital regeneration module in communication with the digital switch matrix, wherein the digital regeneration module is configured to demodulate at least a portion of the plurality of data packets to extract a digital bitstream therefrom, to digitally process the bitstream, and to remodulate the bitstream after processing; and
 - a digital combiner configured to communicate with the receiving ports to receive the plurality of data packets and to re-assemble the plurality of data packets to thereby form a plurality of output sub-bands for transmission on an output beam of the communications satellite.
15. (Original) A method of processing a sub-band spectrum received on an uplink beam at a digital payload for a communications satellite, the method comprising the steps of:
 - digitally dividing the sub-band spectrum into a plurality of frequency slices;
 - routing each of the plurality of frequency slices to at least one of a plurality of receiving ports; and
 - digitally processing at least a portion of the frequency slices; and
 - digitally re-assembling the portion of the plurality of frequency slices after processing to thereby form a plurality of output sub-bands for transmission on an output beam of the communications satellite.
16. (Original) The method of claim 15 further comprising the steps of converting the analog uplink beam to a digital representation of the sub-band spectrum prior to the dividing step.

17. (Original) The method of claim 16 wherein the converting step occurs at an IF frequency rate.
18. (Original) The method of claim 15 wherein the routing step comprises simultaneously routing at least a portion of the plurality of frequency slices to multiple receiving ports to thereby implement a multi-cast function.
19. (Original) The method of claim 15 further comprising the steps of monitoring the sub-band spectrum to identify changes in bandwidth consumption and adjusting the routing step in response to the changes to thereby improve the efficiency of the digital payload.
20. (Original) A satellite receiving a plurality of uplink beams and producing a plurality of downlink beams, the satellite comprising:
 - an uplink antenna configured to receive the plurality of uplink beams;
 - a downlink antenna configured to produce the plurality of downlink beams;
 - an analog-to-digital (A/D) converter configured to convert the uplink beams to digital uplink equivalents;
 - an all-digital payload comprising:
 - a digital channelizer configured to receive the digital uplink equivalents and to divide the digital uplink equivalents into a plurality of frequency slices;
 - a digital switch matrix configured to route each of the plurality of frequency slices to at least one of a plurality of receiving ports;
 - and
 - a digital combiner configured to communicate with the receiving ports to receive the plurality of frequency slices and to re-assemble the plurality of frequency slices to thereby form a plurality of digital output sub-bands;; and

a digital to analog (D/A) converter configured to convert the digital output sub-bands to downlink beams transmitted by the downlink antenna.

21. (Original) The satellite of claim 20 wherein the A/D converter is further configured to sample the uplink beams at an IF frequency.
22. (Original) The satellite of claim 20 wherein the D/A converter is further configured to sample the output sub-bands at an RF frequency.
23. (Original) The satellite of claim 20 wherein the uplink antenna is a digital beam-forming antenna.
24. (Original) The satellite of claim 20 wherein the uplink antenna is a phased array antenna.
25. (Original) The satellite of claim 20 wherein the downlink antenna is a digital beam-forming antenna.
26. (Original) The satellite of claim 20 wherein the downlink antenna is a phased array antenna.
27. (Original) A digital payload for a satellite configured to receive a sub-band spectrum via an uplink beam and to provide a downlink beam, the digital payload comprising:
 - a backplane housing having a backplane bus; and
 - a plurality of processing cards, each processing card comprising:
 - a channelizer circuit configured to receive the sub-band spectrum and to divide the sub-band spectrum into a plurality of frequency slices;
 - a digital switch matrix comprising a plurality of switching circuits, wherein each of the plurality of switching circuits is configured to

route a portion of the plurality of frequency slices to at least one of a plurality of receiving ports via the backplane bus; and
a digital combiner circuit configured to communicate with the receiving ports to receive the plurality of frequency slices and to re-assemble the plurality of frequency slices to thereby form an output sub-band for transmission on the output beam.

28. (Original) The digital payload of claim 27 wherein each of the plurality of processing cards further comprises a regeneration circuit configured to demodulate at least a portion of the sub-band spectrum to thereby extract a digital bitstream therefrom, to digitally process the bitstream, and to remodulate the bitstream after processing.

29. (Original) Means for processing a sub-band spectrum received on an uplink beam at a communications satellite, the means for processing comprising:

means for dividing the sub-band spectrum into a plurality of frequency slices;

means for routing each of the plurality of frequency slices to at least one of a plurality of receiving ports; and

means for communicating with the receiving ports to receive the plurality of frequency slices and to re-assemble the plurality of frequency slices to thereby form a plurality of output sub-bands for transmission on an output beam of the communications satellite.

30. (Original) The means for processing of claim 29 further comprising a means for digitally regenerating the sub-band spectrum, wherein the means for digitally regenerating comprises means for demodulating at least a portion of the sub-band spectrum to extract a digital bitstream therefrom, means for digitally processing the bitstream, and means for remodulating the bitstream after processing.

31. (Withdrawn) A method of allocating a satellite resource within a satellite, the method comprising the steps of:

performing an initial allocation of the satellite resource;

monitoring the allocation of the satellite resource during operation of the satellite
to identify available portions of the satellite resource and over-utilized
portions of the satellite resource; and
re-allocating the satellite resource during operation of the satellite to re-assign
the available portions of the satellite resource to the over-utilized
portions of the satellite resource.

32. (Withdrawn) The method of claim 31 wherein the satellite resource is bandwidth.
33. (Withdrawn) The method of claim 31 wherein the satellite resource is electric power.
34. (Withdrawn) The method of claim 31 further comprising the step of adjusting a cost of the satellite resource associated with a customer in response to the re-allocating step.
35. (Withdrawn) A method of independently controlling a portion of a resource within a satellite, wherein the resource is consumed by a plurality of entities each having a digital credential, the method comprising the steps of:
providing an allocation of the resource to a resource manager;
receiving a sub-allocation of the resource among the plurality of entities from the resource manager; and
associating the sub-allocation with the digital credentials received from the entities to thereby enforce the sub-allocation of the resource.
